

Player Spawner
Beta
09/04/22

Introduction

This is an initial version of a simple player spawning system for SoulLink Spawner. This has only been tested with the Invector controller. Please report any bugs or issues to the testing channel on Dicord.

Setting Up

Create an empty game object in your scene and add the PlayerSpawner component to it.

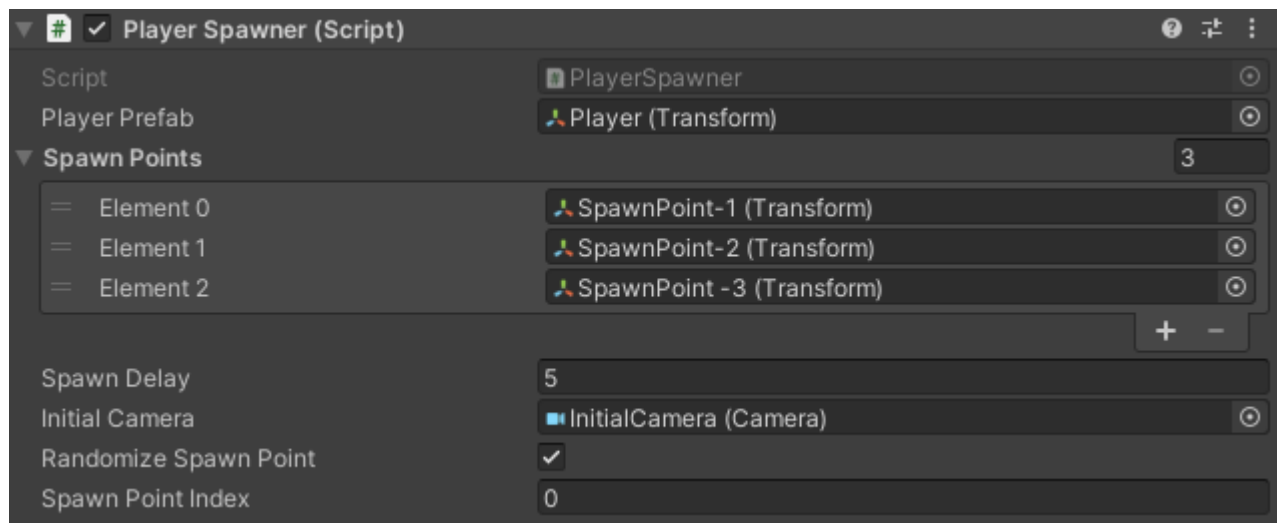

Player Prefab

Assign the player prefab that you wish to spawn.

Spawn Points

Add as many entries as you want for player spawning points. Assign each one to an empty game object in your scene.

In this case, I've created 3 spawn points and assigned them in the PlayerSpawner component.

Spawn Delay

Specify a delay in seconds for the system to wait before spawning or re-spawning the player.

Initial Camera

Assign an initial camera in the scene to be used before the player is spawned. Your player prefab may contain the camera and this will allow you to be able to see the area where the player spawns before it actually spawns.

Randomize Spawn Point

Check this if you want the system to randomly pick from your set of spawn points.

Spawn Point Index

If Randomize Spawn Point is off, this value should be the index of the spawn point you want to use.

Preparing the Player Prefab

Before you can spawn your player prefab, you must add the PlayerSpawn component to the player prefab and set up an event handler for when the player dies. In the case of Invector, we assign the PlayerSpawn.OnPlayerDeath method to the On Dead event:
